## Question 7

| Propose two policy measures an organisation can implement to protect against common data security threats, justifying how each measure enhances security. [4 marks] |  |  |  |
|---|--|--|--|

## Marking Guide

| # | Sample Response   | Response               | Mark |
|---|---|------------------------|------|
| 7 | 1. Educate Users: Organisations can implement regular   | Names first policy     | 1    |
|   | training for employees to recognise common data security  | Justifies first policy | 1    |
|   | threats like phishing attempts, suspicious links, and unsafe  | Names second policy    | 1    |
|   | downloads. This measure enhances security by reducing   | Justifies second       |      |
|   | the likelihood of human error, which is a common cause of   | policy                 |      |
|   | breaches.   |                        |      |
|   | Implement Strong Passwords and Multi-Factor   |                        |      |
|   | Authentication (MFA): Organisations should enforce  |                        |      |
|   | policies requiring complex passwords and enable MFA for   |                        |      |
|   | all accounts. This measure enhances security by adding an   |                        |      |
|   | extra layer of protection, making it significantly harder for attackers to gain unauthorised access even if a password is |                        | 1    |
|   | compromised.  |                        |      |
|   | (Other valid policy measures include: Regular Backups, Restrict   |                        |      |
|   | User Privileges, Secure Browsing Practices, Incident Response   |                        |      |
|   | Plan, Data Protection Policies, Penetration Testing, Code   |                        |      |
|   | Reviews, Assess Vendors, Monitor Supply Chain, Reputable  |                        |      |
|   | Sources, Comprehensive Plan, Automated/Manual Testing,  |                        |      |
|   | Version Control, Consistency Checks, Conflict Detection).   |                        |      |
| 8 | A secure feature of a Virtual Private Network (VPN) is its use of   | Describes feature      | 1    |
|   | encryption to create a secure, private tunnel for data  | (encryption/tunnel)    |      |
|   | transmission over public internet connections. VPNs use   | Names protocols        | 1    |
|   | various protocols like OpenVPN or WireGuard which employ  | Explains how it        |      |
|   | strong, modern security to encrypt the data. This feature   | protects transmission  |      |
|   | improves data security during network transmission because  |                        | 1    |
|   | even if an attacker intercepts the data, it remains unreadable  |                        |      |
|   | without the decryption key, effectively protecting against  |                        |      |
|   | eavesdropping and man-in-the-middle attacks.  |                        |      |
